The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed construction of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed activity of (II) or to treat disease states involving (II). (II) is cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cusful for generating antibodies against it, detecting or quantitating a supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capacities, forensics, genemapphig, identification of mutations of diagnostics, forensics, genemapphig, identification of mutations and to produce other types of date and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WHD at celectronic format directly from WHD at celectronic format directly from WHD at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

Polymucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AAB58106 - AAB58548. Lung cancer associated proteins and polymucleotide sequences, their agonists, and antagonists may have neuroprotective; cytostatic; cardioactive; and antagonists may have neuroprotective; cytostatic; cardioactive; and communicative mascular active general; vulnerary; gastrointestinal communication also includes antibodies specific for the protein or polymucleotide sequences. The lung cancer associated polymucleotide sequences may be used for detection of lung cancer, chromosome cor research purposes. The proteins may be used to treat disorders such as contract, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases.

Colymucleotide sequences AAF18425 - AAF18433 and peptide AAB5849 are used in the course of the invention for the identification and characterisation of the polymucleotide and protein sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

New polynucleotides and polypeptides, useful for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy.

Claim 1; Page; 222pp; English.

The invention discloses a polymucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel colling defined nucleotide sequences which encode novel to polymeptides. Also claimed is a polymeptide encoded by the polymucleotide or peptide or paptide or peptide, an antibody binding to the polymeptide or peptide or peptide of the polymucleotide, immunologically assaying the polymeptide or peptide or peptide of the polymucleotide by contacting the polymucleotide or peptide or peptide of the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymucleotide in an expressible manner and an antisense polymucleotide. The oligonucleotide or as a probe for detecting the polymucleotide. The polymucleotide and encoded proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and adiagnostic marker or medicines for regulation of their expression and activity, or as targets of genes many be included in them, for developing a diagnostic marker or configuration. Membrane proteins, signal transduction-related proteins, tisease-related proteins, transcription-related proteins, disease-related proteins, creamedicion membrane proteins, disease-related proteins are conding them can be used as indicactors for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence data for this patent is not represented in the printed proverse parton, but is based on sequence information supplied by the European Patent Office.

protein-tyrosine kinase (EC 2.7.1.112) - feline sarcoma virus (fragment)

Nathernate names: gag-onc fusion protein

C; Species: feline sarcoma virus

C; Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 09-Jul-2004

C; Accession: S04205

R; Kappes, B; Ziemiecki, A.; Mueller, R.G.; Theilen, G.H.; Bauer, H.; Barnekow, A.

Oncogene 4, 363-372, 1989

A; Title: The TP1 isolate of feline sarcoma virus encodes a fgr-related oncogene lacking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A Introns: 41/2; 94/1; 135/1

C; Function:
A; Description: catalyzes the phosphorylation of a peptidyl tyrosine residue by ATP
C; Superfamily: Tyrosine-protein kinase, proto-oncogene SRC type; protein kinase homology
C; Keywords: ATP; phosphotransferase; tyrosine-specific protein kinase
F; 16-65/Domain: SH3 homology <SH3>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A, Residues: 1-450 <HOL>

A; Map position: catalyzes the phosphorylation of a peptidyl tyrosine residue by ATP
C; Superfamily: Tyrosine-protein kinase, proto-oncogene SRC type; protein kinase homology
C; Keywords: ATP; autophosphorylation; blocked amino end; lipoprotein; myristylation; pho
C; Superfamily: Tyrosine kinase hok #status predicted <MAT>
F; A: 2005/Product: protein-tyrosine kinase hok #status predicted <MAT>
F; A: 112/Domain: SH3 homology <SH2>
F; A: 2005/Domain: protein kinase homology <KIN>
F; A: 2005/Region: protein kinase homology <KIN>
F; A: 2005/Region: protein kinase ATP-binding motif
F; A: 2006/Modified site: myristylated amino end (Gly) (in mature form) #status predicted
F; 3/Binding site: palmitate (Cys) (covalent) #status predicted
F; 300/Binding site: Lys #status predicted
F; 300/Binding site: Dys #status predicted

ordie. It is required in higher cells for entry into S-phase and
mitosis. Component of the kinase complex that phosphorylates the
repetitive C-terminus of RNA polymerase II. Catalytic component of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tyrosine phosphate.
SUBUNIT: Forms a stable but non-covalent complex with cyclin B in mature oocytes (By similarity).
                                                                                                                                             19-JUL-2005, sequence version 1.
07-FBB-2006, entry version 6.
Chromosome 14 SCAFIS503, whole genome shotgun sequence. (Fragment).

FUNCTION: Plays a key role in the control of the eukaryotic cell cycle. It is required in higher cells for entry into S-phase and mitosis. Component of the kinase complex that phosphorylates the repetitive C-terminus of RNA polymerase II. Catalytic component of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                    tyrosine phosphate.
-!- SUBUNIT: Forms a stable but non-covalent complex with cyclin B mature oocytes (By similarity).
-!- SIMILARITY: Contains 1 SH3 domain.
                                                                                                                                                                                                                                                                                                                                                          MPF (By similarity).
CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ATP-binding, Kinase, Nucleotide-binding, SH3 domain, Transferase, Tyrosine-protein kinase.

SUBCELLULAR LOCATION: Cytoplasm (By similarity).
TISSUE SPECIFICITY: Widely expressed. Highly expressed in brain, placenta and prostate. Expressed in tumor cells such as hepatoma cells LO2, cervix carcinoma cells HeLa, ovary cancer cells H08910 and chronic myelogenous leukemia cells K562, but not in other tumor cells such as epidermoid carcinoma (4431).
SIMILARITY: Belongs to the Tyr protein kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            TISSUB=Fetal brain;

May act by activating both MAP kinase and phosphatidylinositol 3'-kinases (PI3K) pathways (By similarity).

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TISSUE=Amygdala;

"Molecular cloning and expression of Chicken C-terminal Src kinase:
Tack of stable association with C-Src protein.";
Proc. Natl. Acad. Sci. U.S.A. 89:2190-2194 [1992].
-!- FUNCTION: Specifically phosphorylates a tyrosine on the SRC kinase. This tyrosine acts as a negative regulatory site. Can also act on the LYN and FYN kinases.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ATP-binding; Kinase; Nucleotide-binding; Phosphorylation; SH2 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

-!- TISSUE SPECIFICITY: Ubiquitous, but most abundant in thymus and spleen, as well as in neonatal brain.
-!- SIMILARITY: Belongs to the Tyr protein kinase family. CSK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PubMed=16166631; DOI=10.1128/MCB.25.19.8486-8495.2005; Xu S., Huo J., Tan J.E.-L., Lam K.-P.; "Cbp deficiency alters CSk localization in lipid rafts but does not affect T-cell development.", Mol. Cell. Biol. 25:6486-8495(2005).

-!- FUNCTION: Specifically phosphorylates Tyr-504 on LCK, which acts as a negative regulatory site. Can also act on the LYN and FYN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- SUBCELLULAR LOCATION: Mainly cytoplasmic.
